ADAPTATION POLICY ANALYSIS (III)

DEMANDS/AVAILABILITY: Comparison between projections
with and without adaptation measures

Model GFDL - RCP4.5 - Long term projection 2060-99

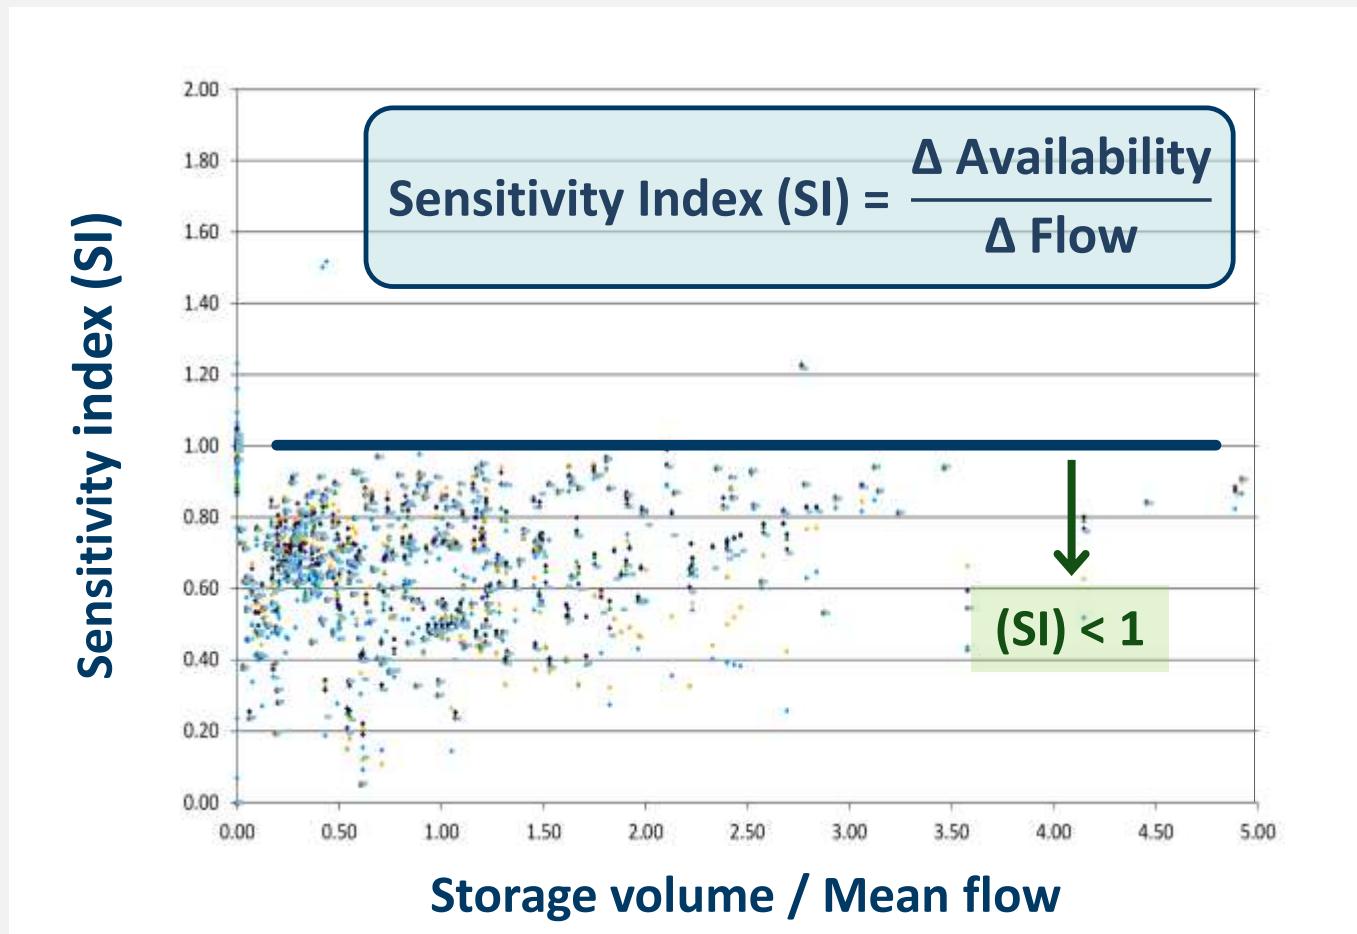

CONCLUSIONS

- The results show that the balance between water availability and demands is threatened in some regions.
- Impacts of climate change on water availability are uncertain and heterogeneous among the different climatic models.
- However, it is possible to identify areas of Southern Europe and some areas of Central Europe highly populated and low regulated that are vulnerable.
- Improved water management and water governance may compensate adverse effects of climate on water availability.

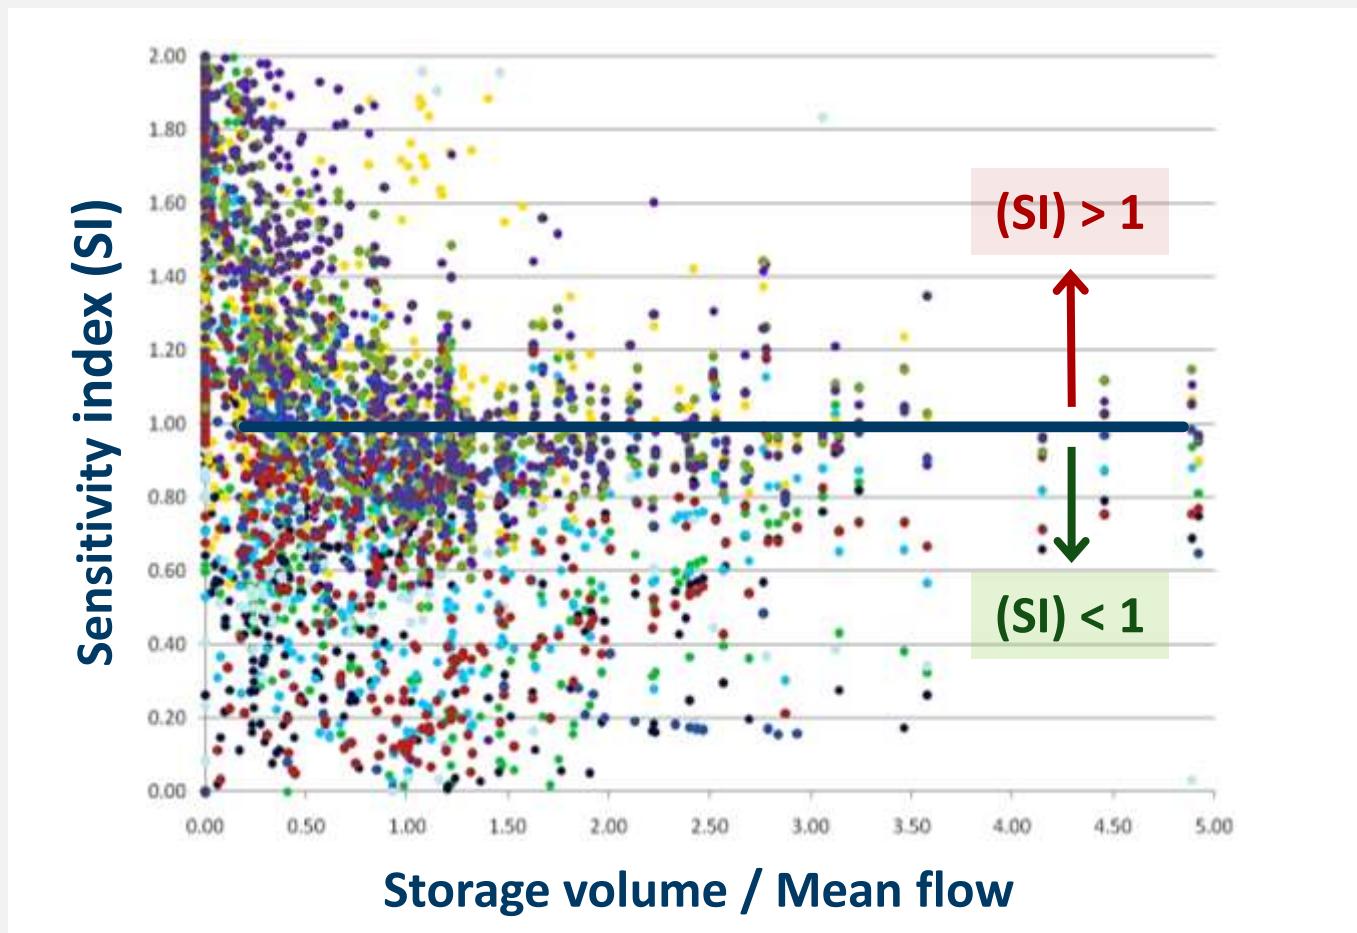

RESPONSE OF THE SPANISH RESERVOIRS TO CLIMATE CHANGE

Initial study: CEDEX climatic projections

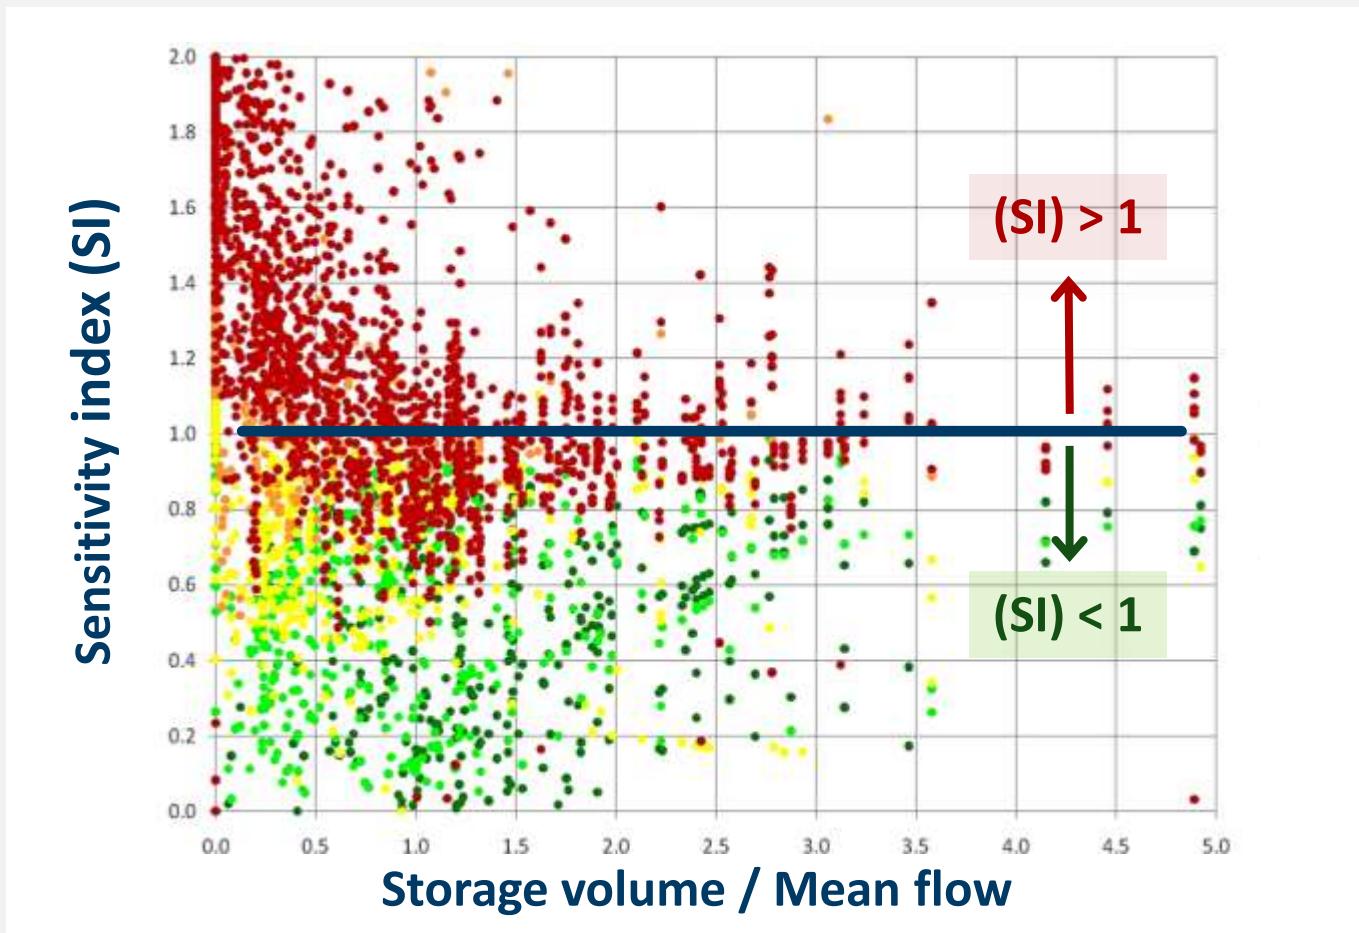

RESPONSE OF THE SPANISH RESERVOIRS TO CLIMATE CHANGE

Initial study: PRUDENCE climatic projections

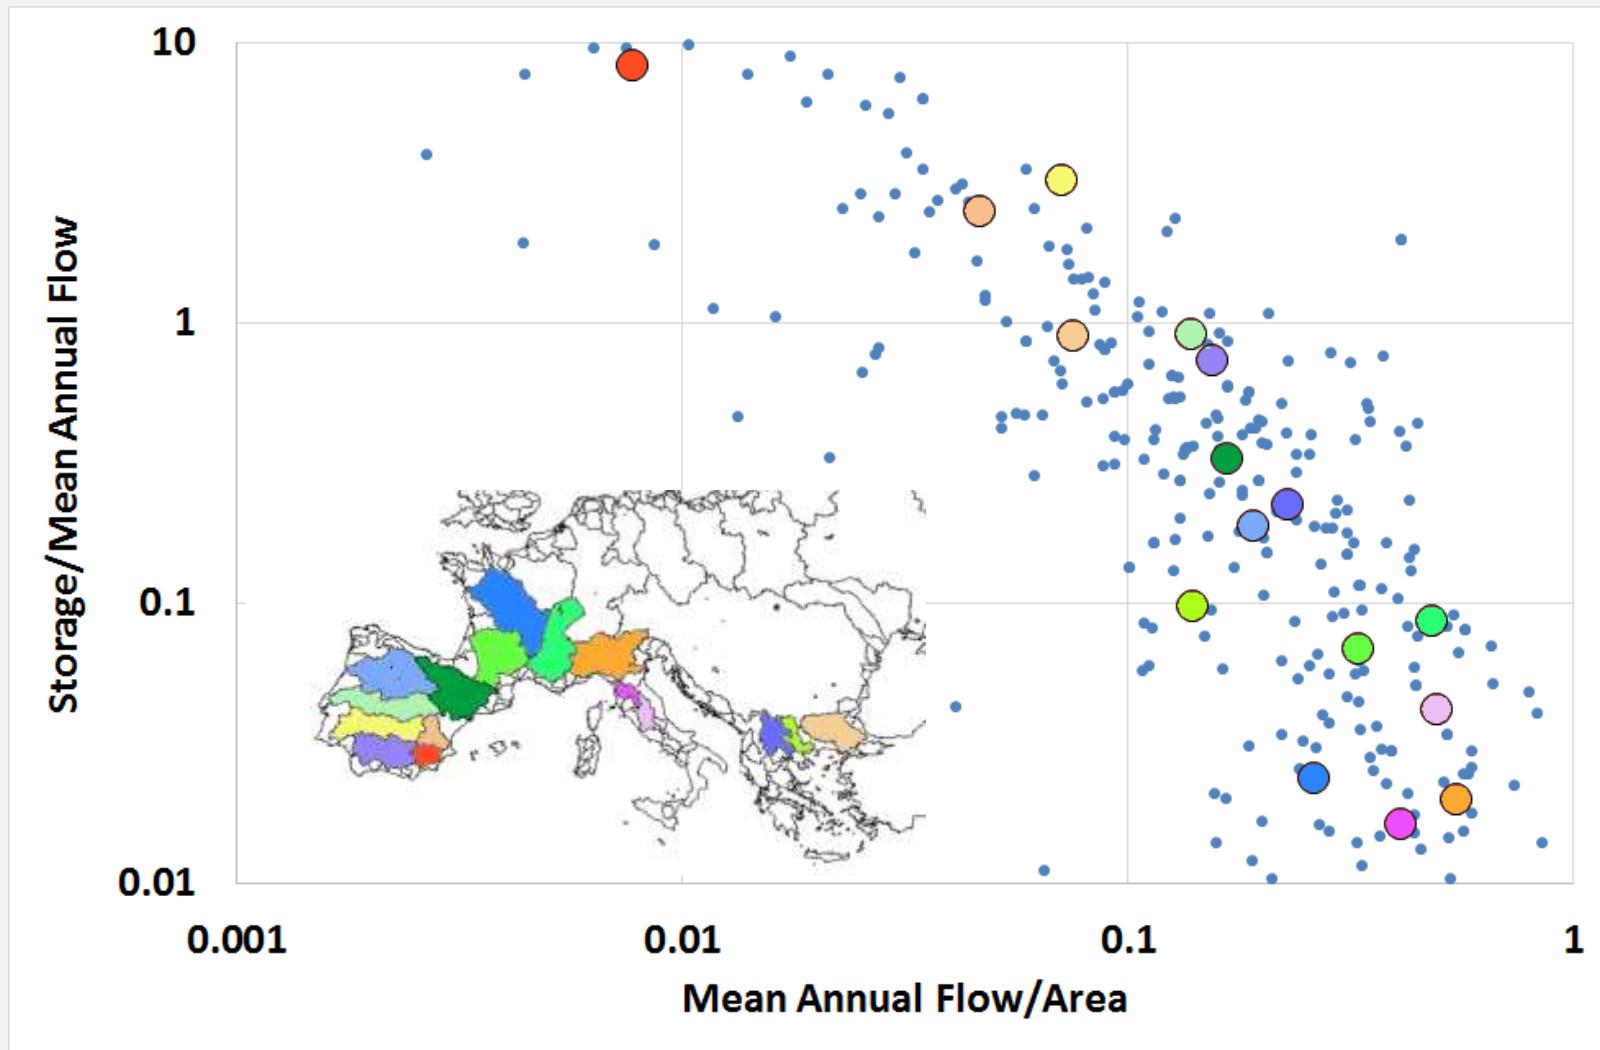

RESPONSE OF THE SPANISH RESERVOIRS TO CLIMATE CHANGE

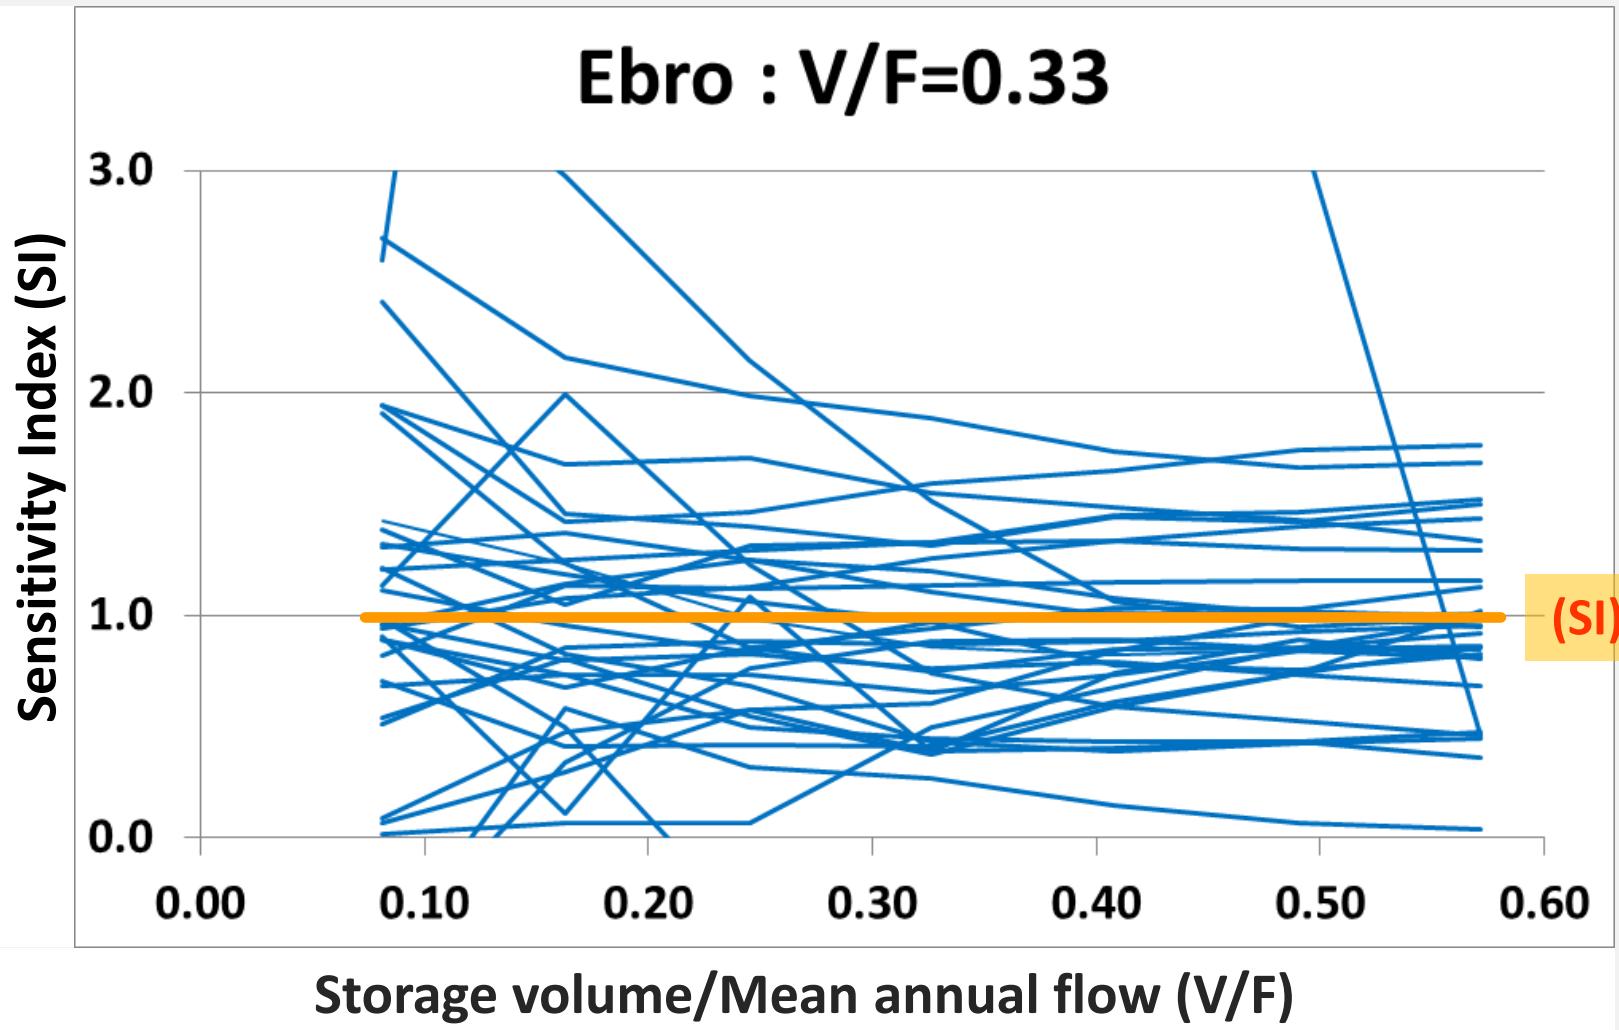

Initial study: PRUDENCE climatic projections

RESPONSE OF THE SOUTERN EUROPE RESERVOIRS TO CLIMATE CHANGE

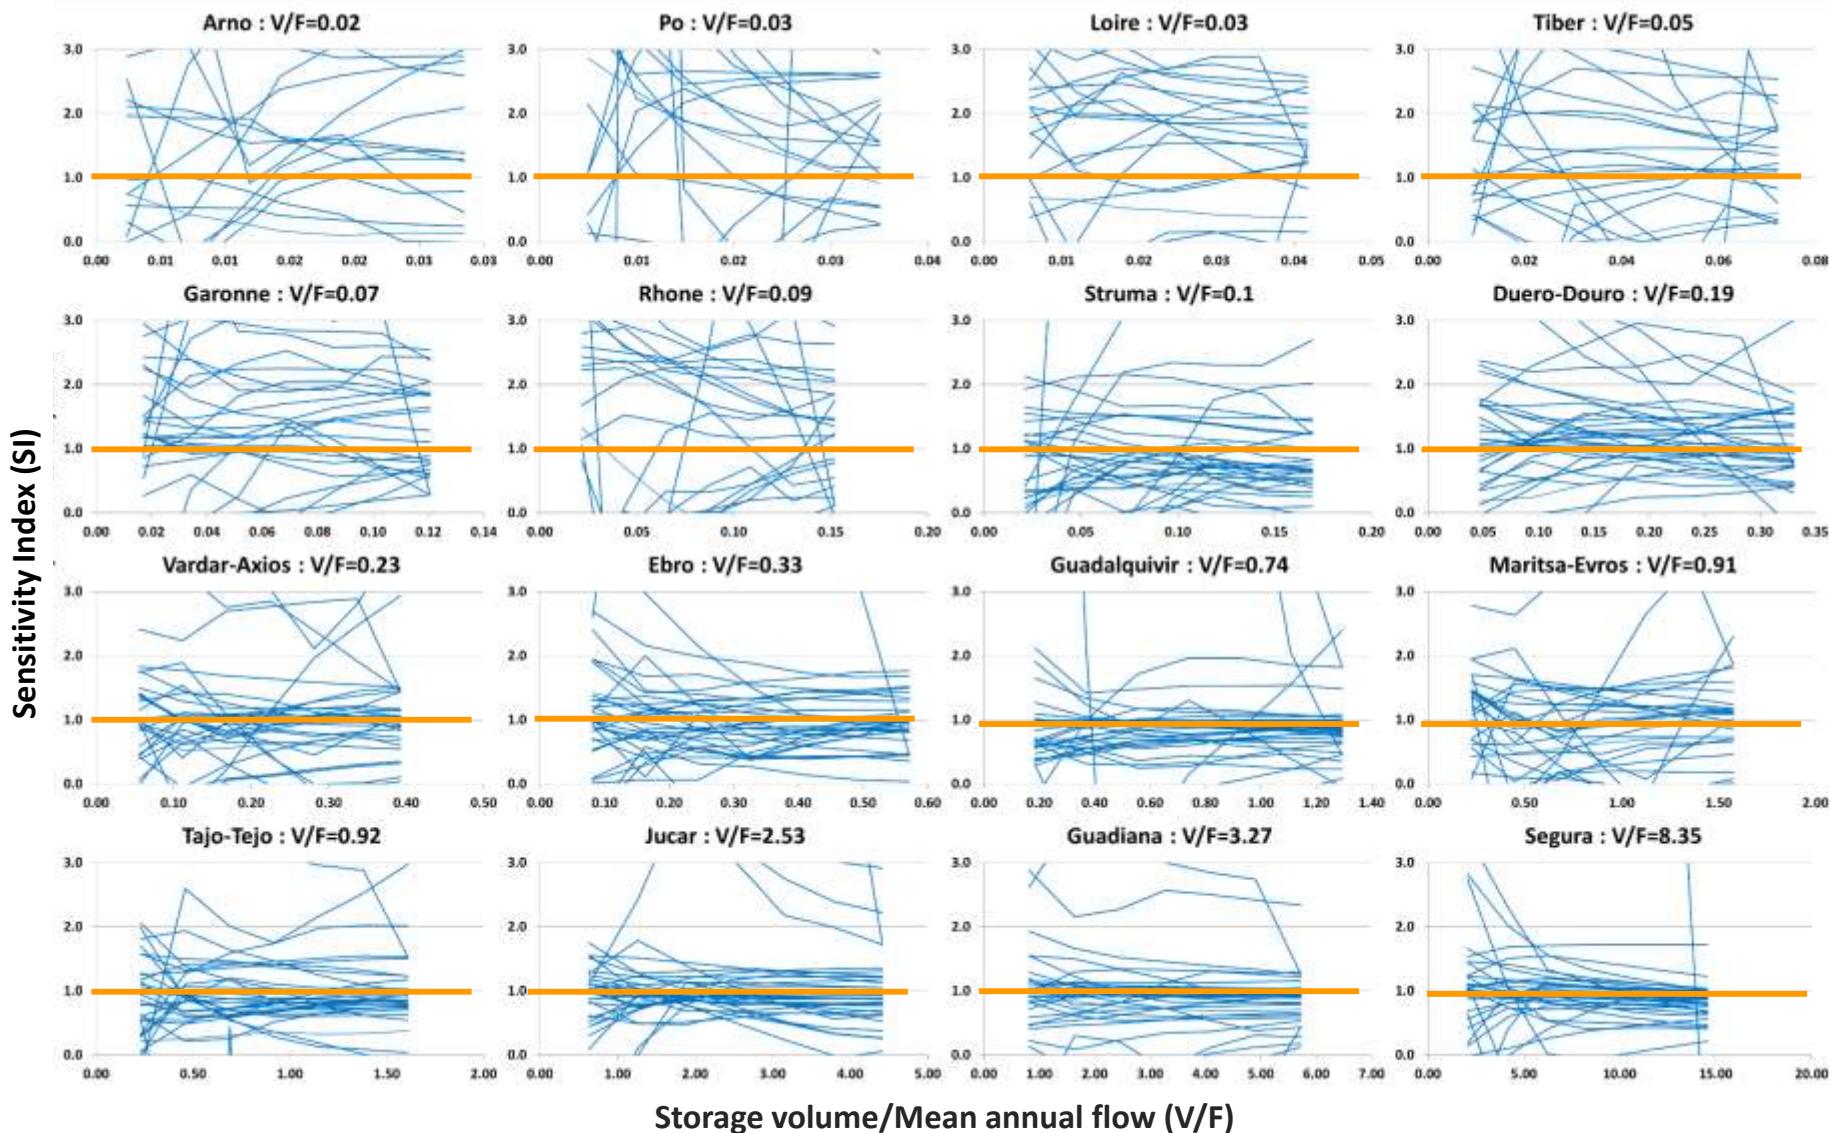

RESPONSE OF THE SOUTERN EUROPE RESERVOIRS TO CLIMATE CHANGE

Variability of sensitivity index is reduced for larger reservoir storage

Reservoir storage attenuates the effects of climate change on availability

ACKNOWLEDGEMENTS

- To European Project BASE “*Bottom-up Climate Adaptation Strategies Towards a Sustainable Europe*”
- To Hessel Winsemius and Laurens Bouwer, from DELTARES, as they provided the simulation results of the PCRGLOBWB model.
